SOLUTION PROPOSAL · NOVEMBER 2026

One system for the whole hotel.

A single operating platform for reservations, guest experience, housekeeping, events, revenue, billing and financial control — with every write auditable and every price, discount and refund under a named approver.

Prepared for
Hotel group leadership

1.0 · November 2026

WHAT THIS PROPOSAL COVERS

Nine modules. One book of record.

LHMS replaces the spreadsheets and disconnected tools a hotel uses to run the desk, the rooms, the events calendar and the month-end — without replacing the judgement of the people who run them. Financial gates keep that judgement documented.

01 **Executive summary**
The operating problem, the platform, the outcomes.

02 **Platform & roles**
One data model, six staff perspectives, multi-property by design.

03 **Front desk & reservations**
Arrivals, room map, booking, folio and waitlist recovery.

04 **Guest experience**
Mobile stay, concierge requests, ordering, loyalty.

05 **Housekeeping & operations**
Turnover states, task release, laundry, lost & found.

06 **Events & banqueting**
Hall diary, clash detection, quotes, holds and cancellation terms.

07 **Revenue & pricing**
One catalogue, rate plans, seasons, bulk import, multi-currency.

08 **Billing & receivables**
Folios, split invoices, payments, refunds, reconciliation.

09 **Financial management**
Dashboards, reports, expenses and the approval queue.

10 **Night audit & compliance**
Sealed business days, audit trail, retention.

11 **Administration & brand**
Roles, policies, integrations, logo-derived theming.

12 **Delivery, security & commercials**
Deployment, implementation plan, scope and next steps.

9
operating modules in one workspace

7
role-based identities — six staff and the guest

19
granular permissions

3
properties in the reference group

1
audit trail for every write

0
installations required on the desk

Screenshots in this document are captured from the running reference workspace with three seeded properties, 102 keys and a live trading day. Names are fictional; the figures, taxes and rules are the product's own.

What makes it different is not another booking screen. It is the join between the operational day and the financial month: the same charge, price list and approval record are visible to the desk, the revenue manager and the auditor.

THE CASE FOR A SINGLE OPERATING SYSTEM

Hotels do not lose money in one place. They lose it between places.

A night sold on one system, a breakfast posted on another, a rate changed in a third and a refund agreed in a chat: each is defensible on its own. The leak appears at month-end, when the folio, the price list and the audit trail disagree.

LHMS puts the commercial rules and the operational day in one model. The rate catalogue that prices a booking is the one finance audits. The folio the guest sees is the revenue the ledger reports. Every discount, refund, rate change and bulk import above a threshold waits for a named second signature before it can move the books.

The result is not only cleaner accounts. It is a faster desk, a housekeeping board that cannot sell an unfit room, an events calendar that cannot double-book a hall, and a guest who sees the same stay the staff see.

THE PLATFORM IN ONE LINE

The operational board and the financial book are the same record, seen by different desks.

Designed for the questions owners ask: what did we earn by department, what is still uncollected, who approved that rate, and what did the night auditor sign?

Revenue assurance

Charges post from the screen that creates them; night audit seals the day and refuses backdated writes.

Margin control

Rate plans, discounts, refunds, FX rates and bulk imports move only through a second signature.

Operational speed

Room release follows task completion; waitlist recovery follows cancellation — automatically.

Guest trust

The mobile portal shows the booked rate, the live folio and the requests the hotel has accepted.

Audit readiness

Every write names its actor, entity and detail; documents carry retention rules.

Group consistency

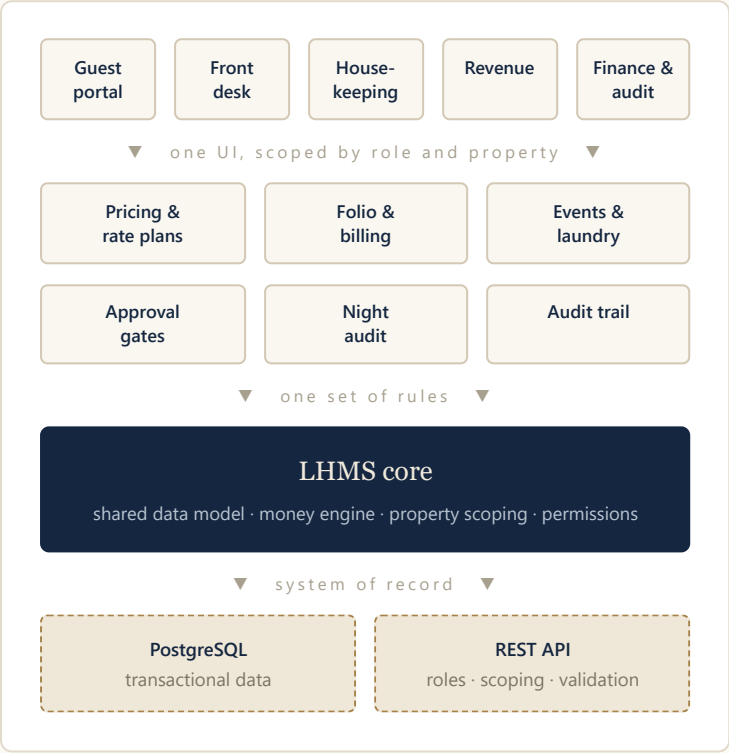

Each property keeps its own brand, policies and rate list inside one group book.

OUTCOME Fewer unbilled nights, a faster month-end, and a single answer to “who agreed this?” — without adding a second system for anyone to reconcile.

ARCHITECTURE

A shared core, not a bundle of screens.

The pricing engine, folio rules, approval gates and audit trail are shared services. Every module calls the same rules, so the desk cannot quote what finance does not recognise.

Deployment note. The current release ships the complete desk workspace and a complete REST/PostgreSQL backend. Operating the desk against the server as the live system of record is a scoped integration phase, agreed at discovery — see the delivery section.

SIX STAFF PERSPECTIVES

ROLE	OPENS ON	GUARDRAIL
Manager	Group dashboard	All properties and approvals
Front Desk	Today	Own property's stays and cash
Housekeeping	Supervisor board	Rooms and tasks, no money
Revenue	Reports	Rates, prices, forecasting
Finance Manager	Financial dashboard	Approvals and the ledger
Auditor	Financial reports	Read-only, full trail

A seventh identity, the guest, only ever sees the mobile portal and their own stay.

Why this matters for a group. A manager may work across hotels; a desk stays pinned to its own. Property scoping is enforced in the data layer, not hidden in the navigation.

SHARED ONCE, ACROSS THE GROUP

- ✓ The pricing engine, tax rules and approval thresholds.
- ✓ The folio, its line types and every money movement.
- ✓ The permission model and one audit trail for every write.

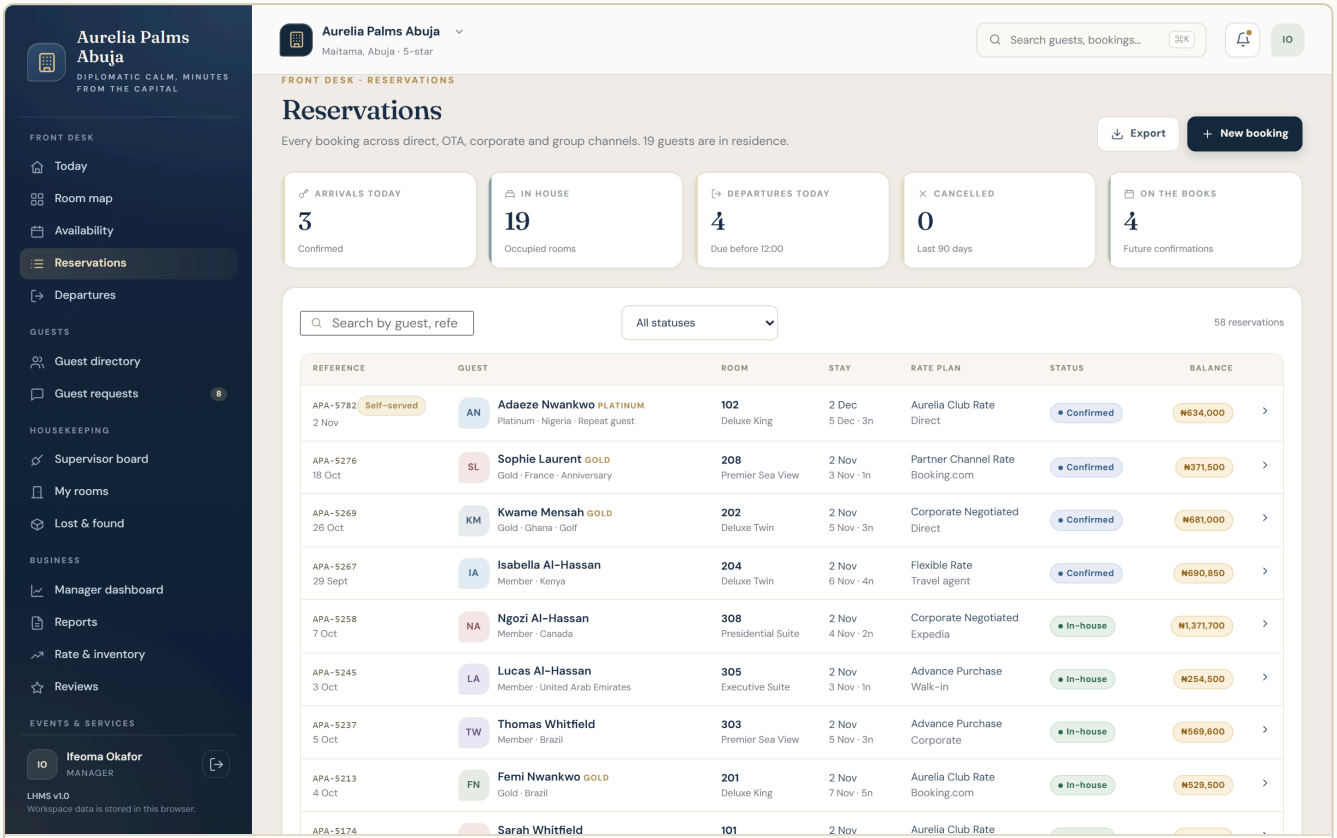

SET PER PROPERTY

- ✓ Rate list, seasons, packages and availability.
- ✓ Policies, thresholds and document retention.
- ✓ Branding, landing copy and integration status.

MODULE 01

The desk sees the whole house before the first arrival.

Arrivals, departures, occupancy, balance on house and the exceptions that need a decision — on one board, in the order the desk should work them.

Reservations. The front desk's own property, with 57 stays across direct, OTA, corporate and group channels, balance, rate plan and status on every row. The four counters above the register are the shift's working set, not a report run later.

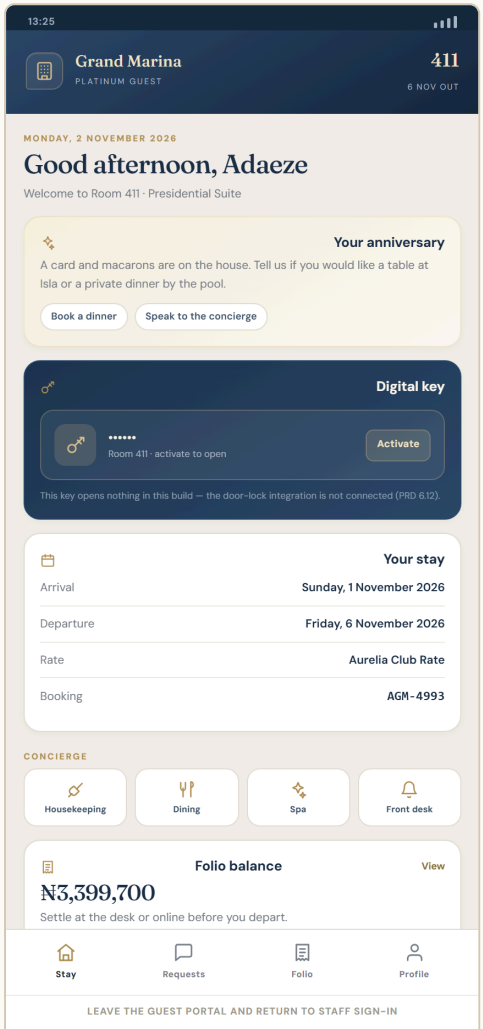

- **Today queue.** VIP arrivals first, then departing balances and in-house requests, with a check-in button on the row.
- **Quote at booking.** Rate plan, extra adult or bed, early check-in and late check-out priced from the live catalogue; deposit taken at the same door.
- **Waitlist recovery.** A sold-out date holds a queue; a cancellation offers the freed room to the next matching stay, with an expiring hold.
- **Room map & timeline.** See each key's state and the nights it is free before quoting a date.
- **One folio.** Room nights, dining, spa, laundry and events post to the stay the guest is standing at.
- **Departures.** Settle the balance, release the room to housekeeping and close the folio without leaving the screen.

SELL THE OUTCOME A receptionist can answer “what is happening in the house right now?” without opening a second system — and a sold-out night stops being a lost sale.

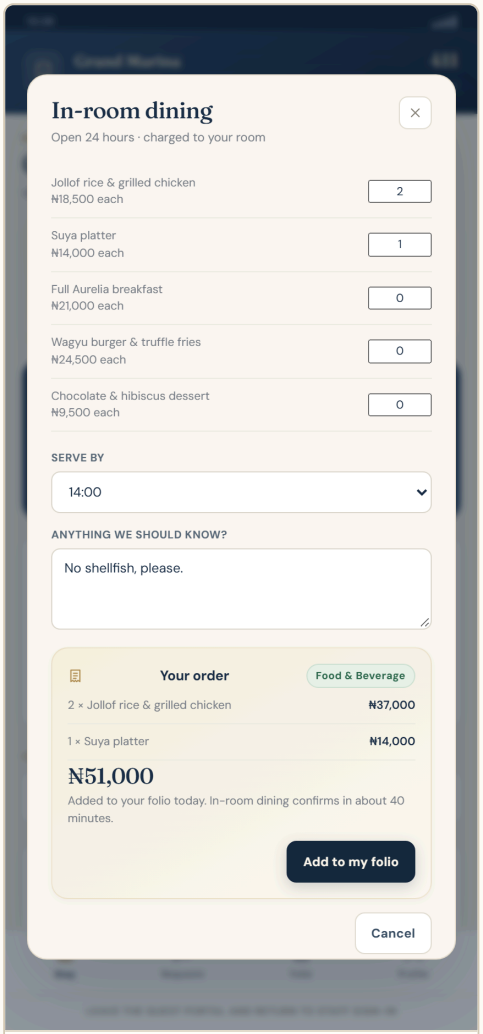

MODULE 02

The stay in the guest's hand.

A mobile portal that carries the real booking, the real folio and a request that reaches the department that can answer it — without an app download.

Stay. Room, rate, arrival and departure, the anniversary note already known to the house, and the folio balance.

Order. In-room dining, spa and laundry priced from the same catalogue the desk bills from; the charge lands on this folio.

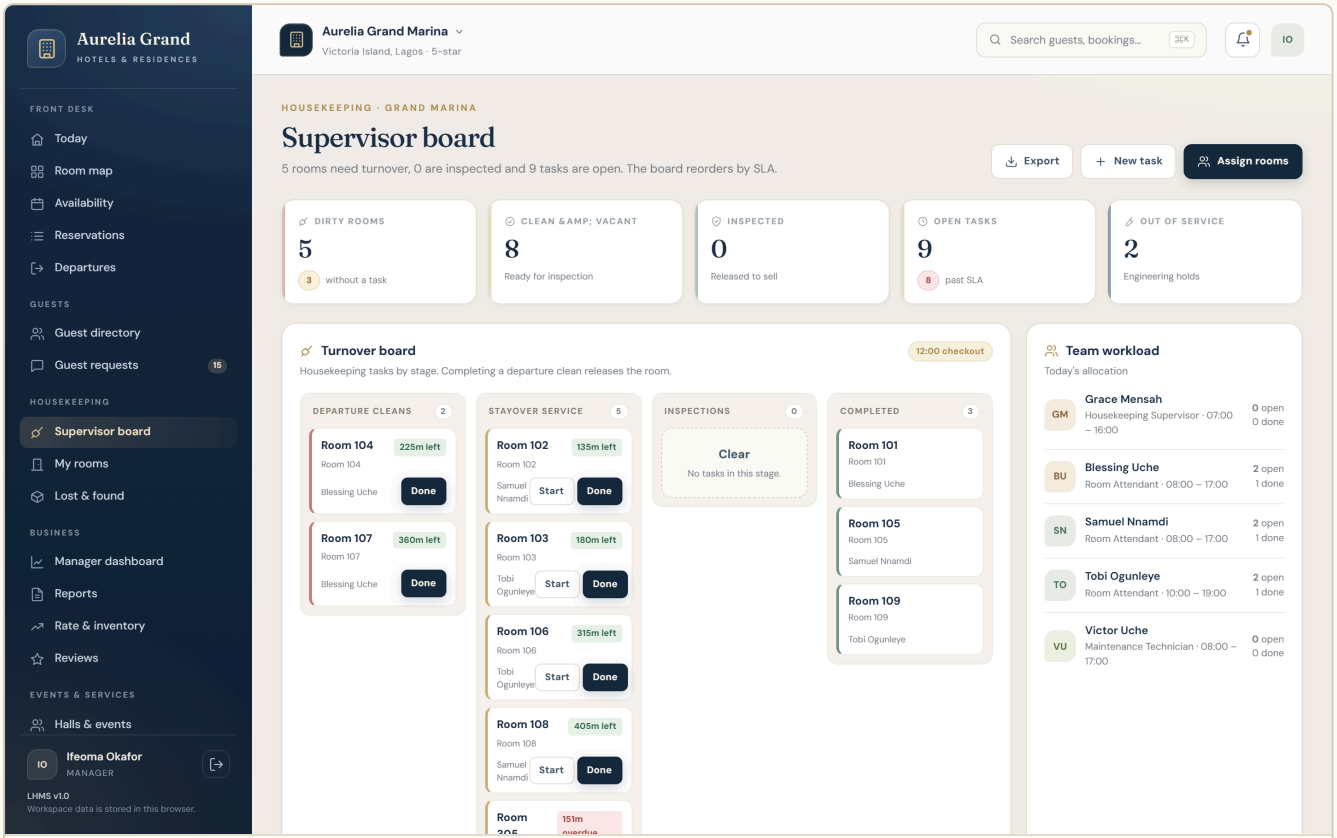

- **Stay without a queue.** Dates, room, rate plan and reference, signed in to the guest's own stay.
- **Self-service booking.** Live availability and a quote, including a waitlist path when the dates are sold out.
- **Profile the house can use.** Preferences, allergies and VIP status appear where staff act on them.
- **Requests routed by type.** Housekeeping, dining, spa and front desk, each with a service level the board can see.
- **Loyalty visible and spendable.** Points earned on a departure can be redeemed against a live folio.
- **Honest surfaces.** The mobile-key panel states that the door-lock connector is not live; no guest is promised a door that will not open.

SELL THE OUTCOME Fewer calls to reception, more in-stay spend captured to the folio, and a guest record that gets richer with every stay instead of starting again.

MODULE 03

A room cannot be sold while its turnover is open.

The supervisor board, the attendant's list and the desk's availability read the same room state. Completing the task is what releases the key.

Supervisor board. Rooms grouped by state — departure turns, dirty, in progress, inspected — with the stay and the attendant attached to each task.

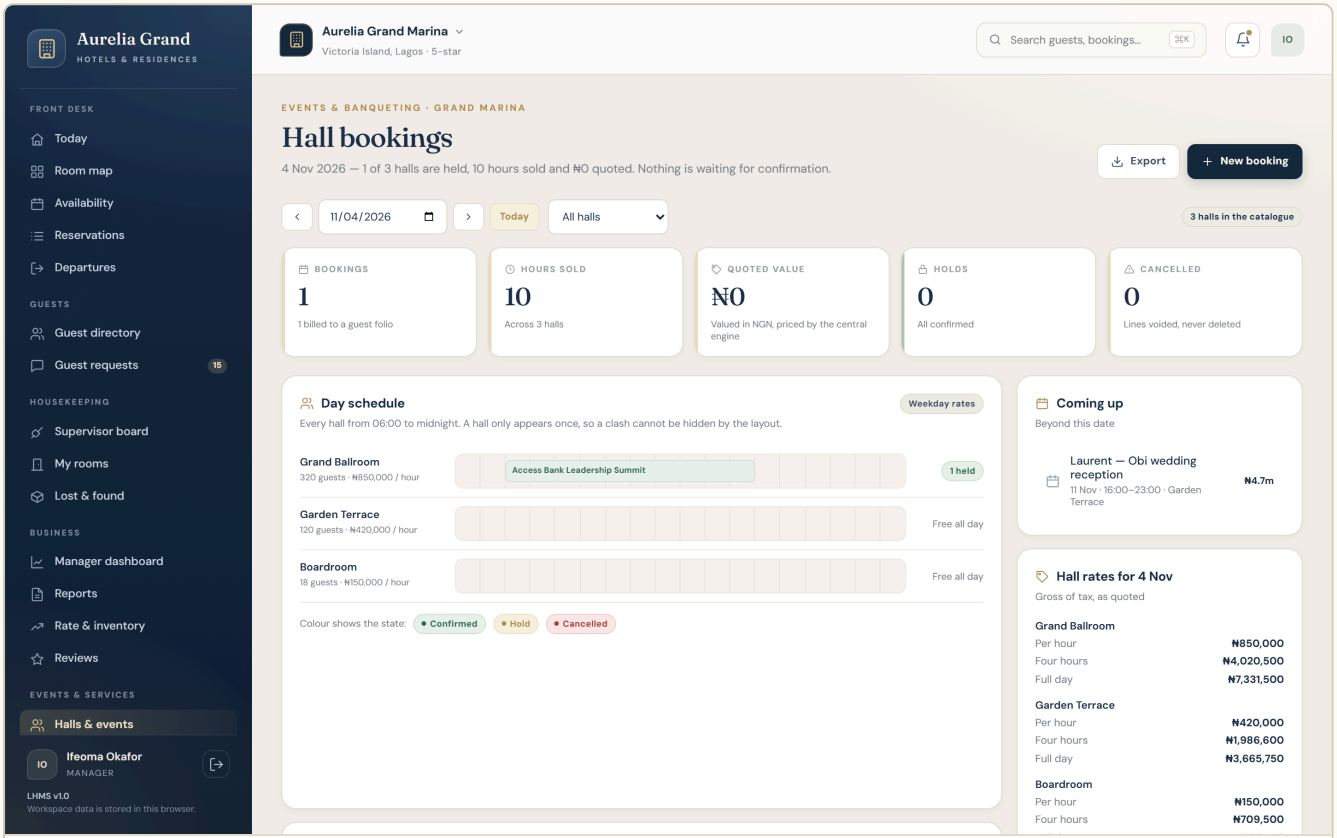

- **Turnover rules, not reminders.** The desk's availability follows the board, so an unclean room is not offered.
- **Laundry as a money path.** Quote by piece or express rate, move the order through stages, and post the charge to the guest's folio.
- **Guest requests with SLA.** The board flags requests at risk before the guest asks again.
- **My rooms.** An attendant sees only their list, in the order the supervisor set.
- **Lost & found.** A register with status, location and an audit trail — not a notebook at the desk.
- **Out-of-order control.** Grounded rooms stay grounded; closing a task cannot quietly release them.

SELL THE OUTCOME The most expensive room in the hotel is the one sold dirty or held clean. LHMS removes both errors from the handover between housekeeping and the desk.

MODULE 04

Every hall once, every hour accounted for.

A day schedule that cannot hide a clash, and a quote that carries its package, add-ons and taxes into the guest's folio when the booking is confirmed.

Hall day schedule. Each hall appears once across the trading day, so an overlap is visible. Holds carry no money; confirmation posts the quoted lines. Rates for the selected date sit beside the diary.

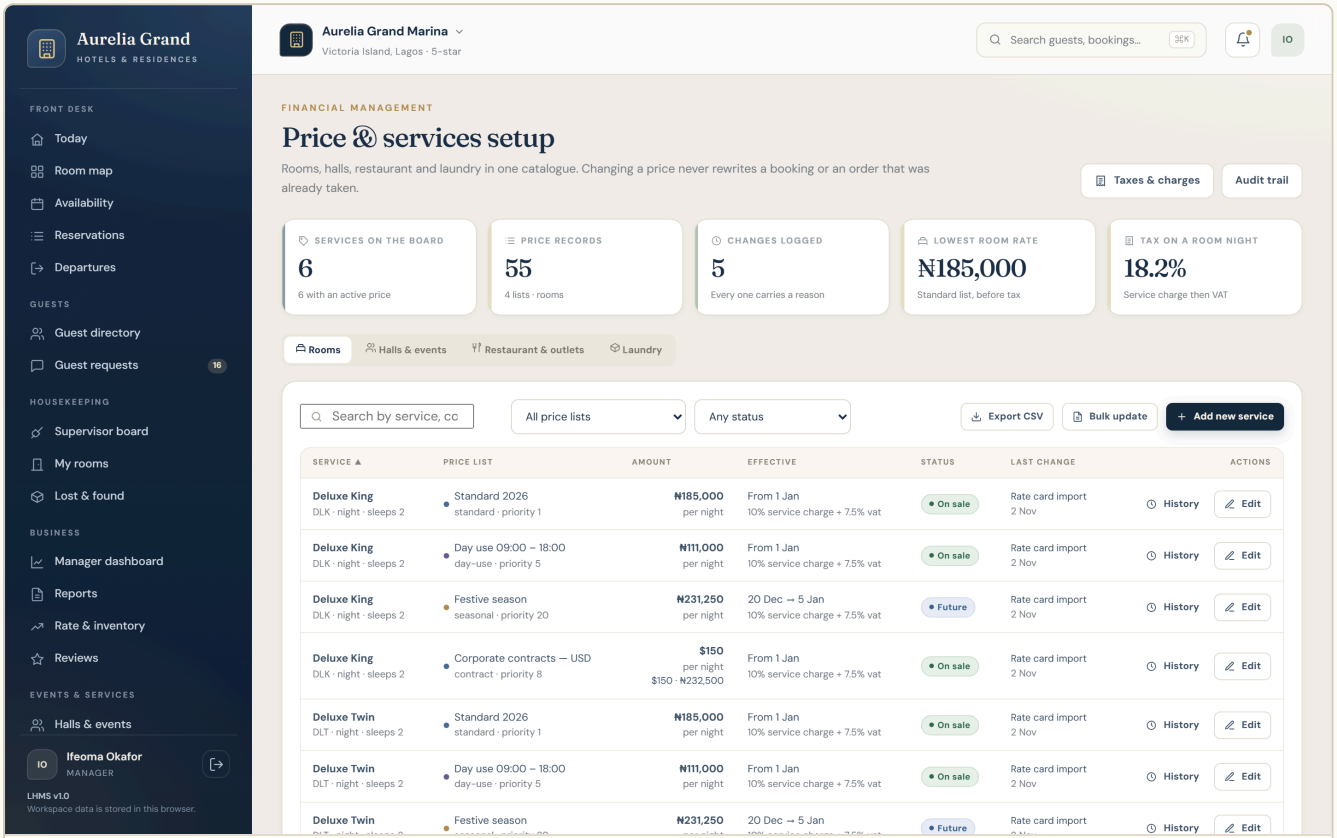

- **Clash detection.** A second booking on the same hall and hours is refused with the booking that holds it named.
- **Add-ons and catering.** Décor, sound and per-guest catering priced and itemised in the quote.
- **Cancellation terms enforced.** The notice window and fee percentage are the hall's, and the void keeps its history.
- **Hourly, half-day or full-day.** The package is priced from the hall's own list, not a typed figure.
- **Hold, then confirm.** A hold reserves the time and posts nothing; confirmation opens the lines on the linked folio.
- **Pipeline beside the diary.** Coming-up events with values, so the sales desk sees what is already sold.

SELL THE OUTCOME Banqueting is where a hotel's best margin and worst reconciliation live together. One quote, one diary and one folio move the margin without the reconciliation.

MODULE 05

One price catalogue, from the room to the laundry list.

Rooms, halls, restaurants, spa, laundry and event extras are priced from the same catalogue. A change is dated, reasoned, approved and auditable.

Rate & inventory. Every room type against every plan, with the plan's multiplier, deposit and cancellation terms. Weekend and seasonal rules are stated, not remembered.

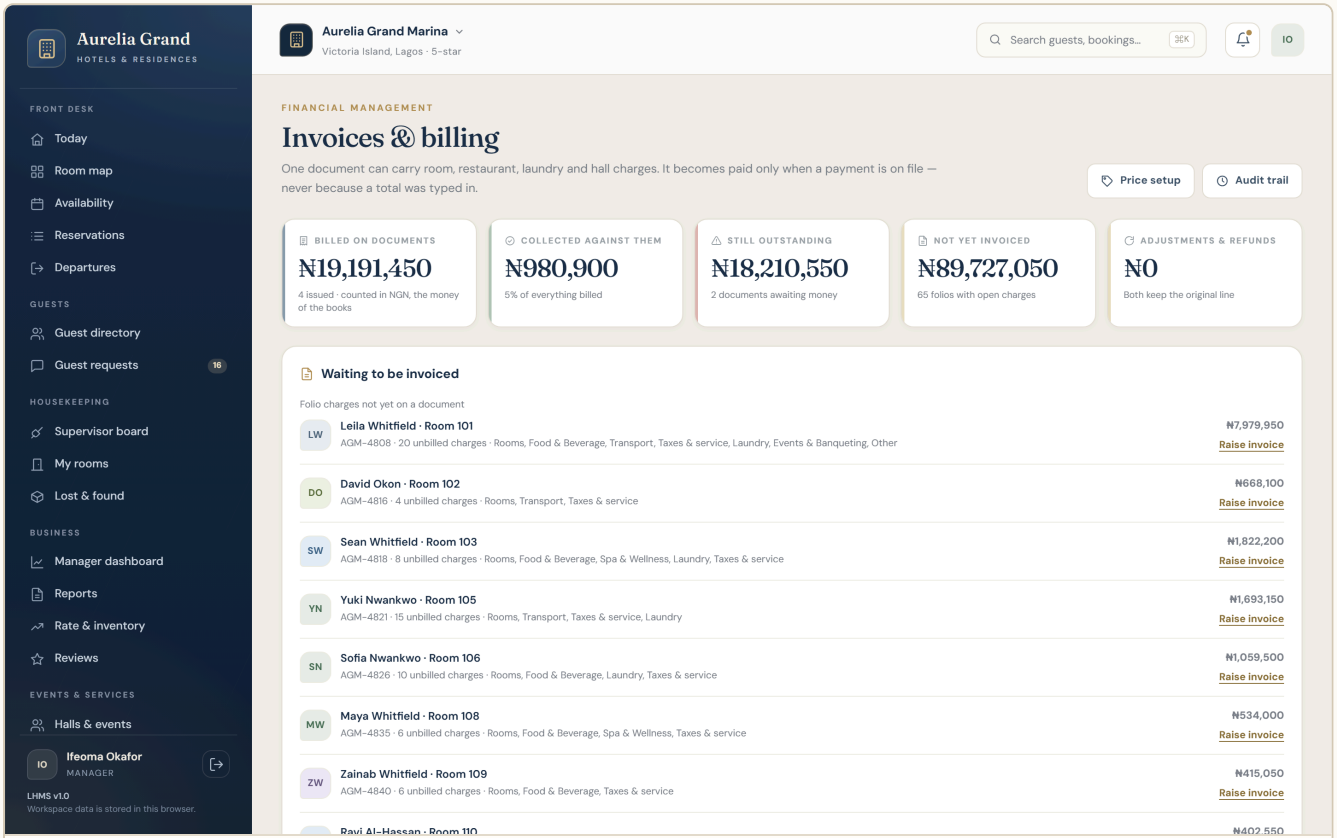

- **Rate plans as rules.** Modifier, deposit percentage and cancellation policy per plan — the quote uses them all.
- **Bulk export and import.** A year of rates in a spreadsheet, validated before it can move the book.
- **Approval gates.** Price moves, discounts, bulk rows, refunds and FX rates wait for a second signature.
- **Seasonal lists with windows.** A festive list only applies inside its dates; the standard list remains the default.
- **Price history.** Every change keeps its old value, actor and reason.
- **Multi-currency.** Properties trade in their own currency; the group's base currency is locked once the books hold money.

SELL THE OUTCOME Rate integrity stops depending on who remembers which spreadsheet. The quote, the folio and the price history quote the same number.

MODULE 06

Every charge finds an invoice. Every invoice finds a receipt.

Folios become invoices with a controlled split, payments are recorded against them, and the unmatched cash is visible before the bank statement arrives.

Invoices & billing. Billed, collected and still owed on one line, with the folios waiting to be invoiced and the departments behind each balance. "Raise invoice" starts from the charges, never from a typed total.

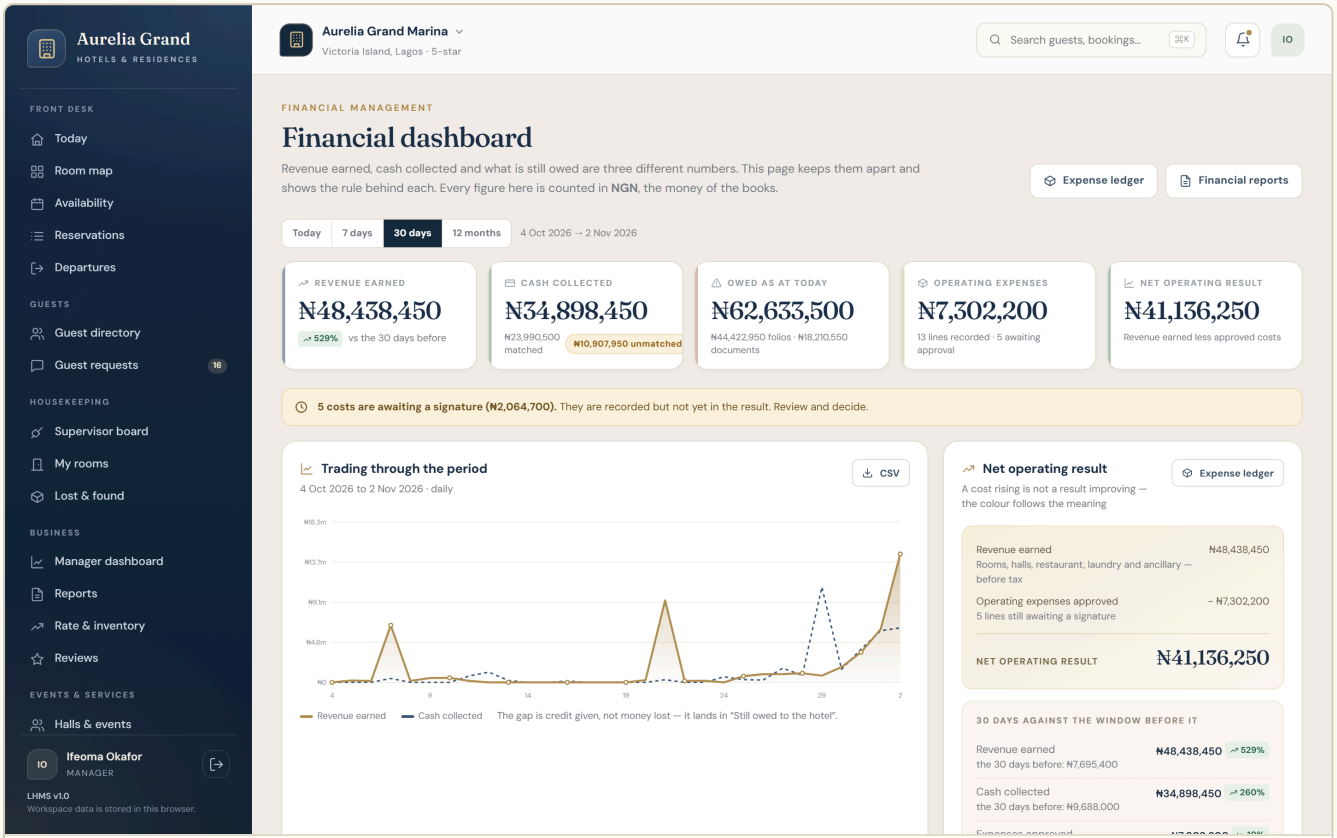

- **Split without losing the folio.** A company and a guest can share one stay's charges on separate invoices.
- **Refunds under approval.** A refund is a gated money movement with a reason and a second signature.
- **Taxes billed, not hidden.** Service charge and VAT appear on the guest document but never inflate departmental revenue.
- **Payments that settle documents.** Cash, transfer and card receipts are applied to the invoice, not typed into a note.
- **Receipts and reconciliation.** Bank-matched and unmatched cash are separated, so the desk knows what is still open.
- **Receivables visibility.** Outstanding balances by guest and company, sorted by what is overdue.

SELL THE OUTCOME Cash is recorded at the moment it is taken. The month-end conversation moves from "did we receive it?" to "what do we do about the balance?"

MODULE 07

The month, explained by department.

Revenue, collections, expenses and margin for the day, the month or the year — drillable to the transaction, and readable by a non-accountant.

Financial dashboard. Earned revenue against collected cash, expenses and departmental performance for the window, with the rules behind each figure stated on the page.

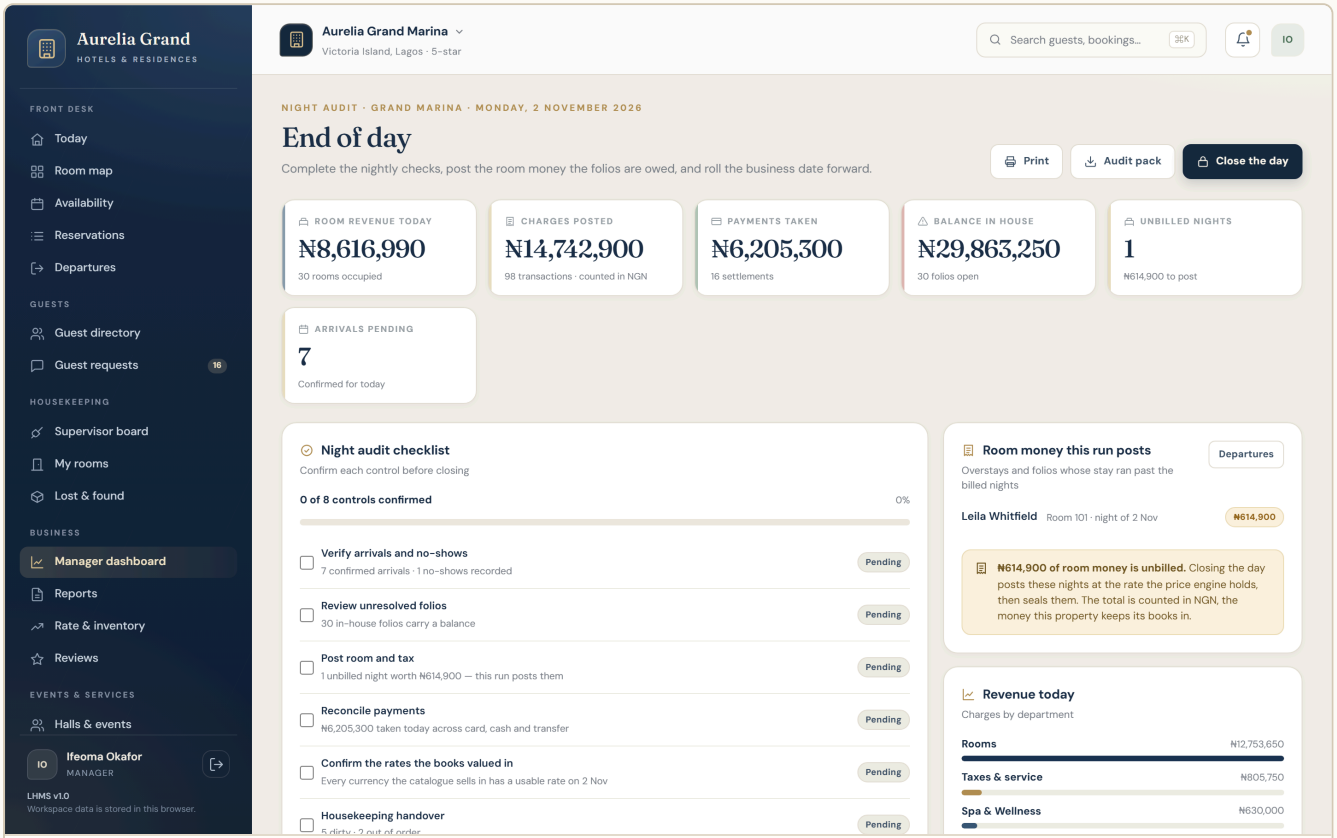

- **Reports that reconcile.** Profit and loss, departmental revenue, service revenue, daily cash, outstanding balances, price history and profitability.
- **Expenses with receipts.** Recorded against a category and property, approved above the threshold, visible to the approver.
- **Send-back with a reason.** A rejected request returns to the requester with the reason on the record.
- **Drill, don't guess.** A rolled-up figure opens its transactions; a quiet day is shown, not smoothed away.
- **Approval queue.** Price changes, discounts, refunds, FX rates and bulk imports held for a named second signer.
- **Role-aware reading.** An auditor sees the books and the trail but cannot post against them.

SELL THE OUTCOME Owners get a defensible month at any point in the month, and managers see the financial effect of today's decisions before the close.

MODULE 08

The day closes once, and cannot be quietly reopened.

A guided night audit confirms each department, packs the day's figures, rolls the business date and seals it. Writes into a sealed day are refused, not reconciled later.

End of day. Each control — arrivals, unresolved folios, room and tax, payments, currency, housekeeping — is confirmed before the close. The unbilled night and its value are stated on the page, not discovered after the roll.

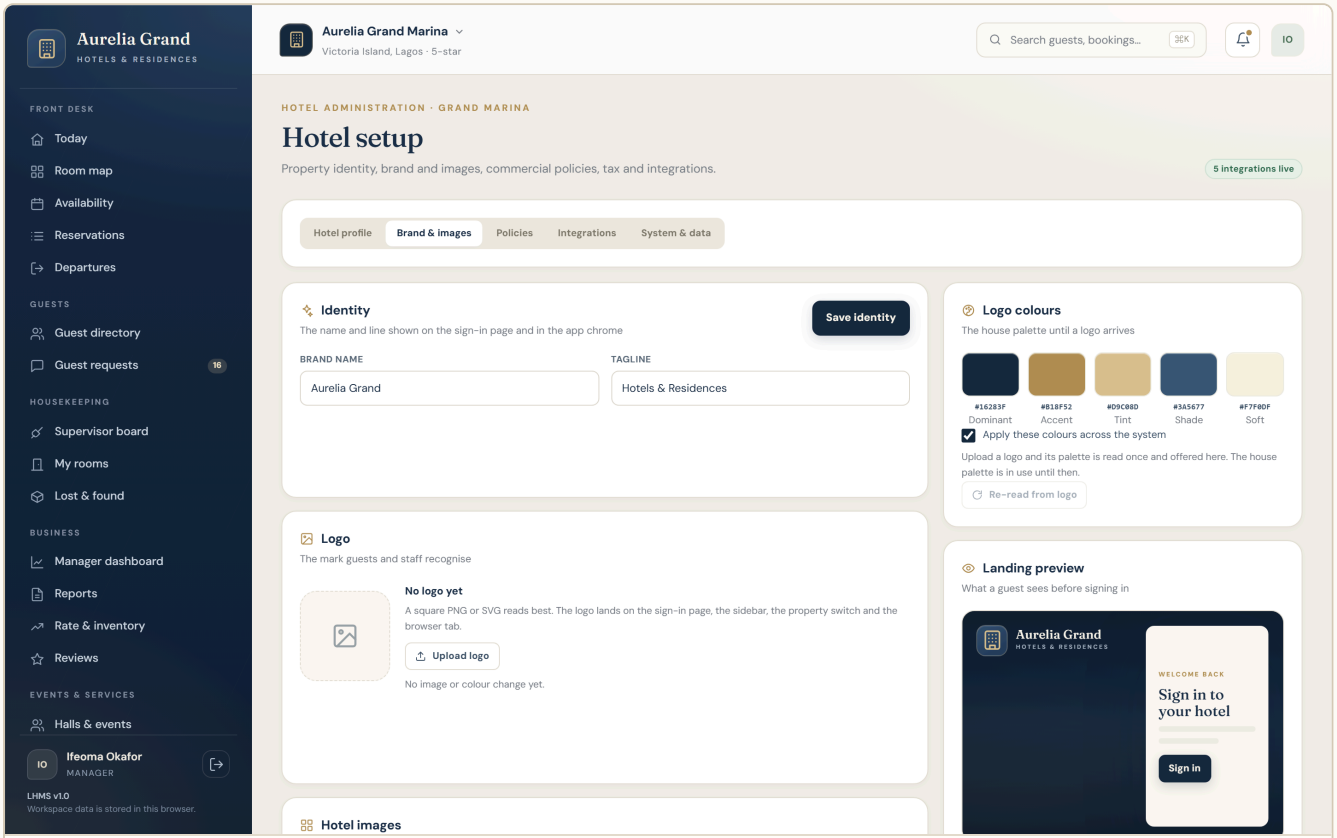

- **Departmental confirmation.** Each revenue centre signs its day before the pack can close.
- **Exceptions, then close.** Unsettled folios and open rooms are shown before the audit is allowed to roll.
- **Document register.** Retention periods per document type, guest visibility and erasure requests recorded rather than silently deleting history.
- **Business-date seal.** A backdated charge or payment is refused with the closed date named.
- **Audit trail for every write.** Actor, entity, action and a human-readable detail — operational and financial in one log.
- **Night audit, signed.** The close is a named act, not an automated job nobody can question.

SELL THE OUTCOME Month-end starts from a closed, signed day. The audit committee's first question — "is this figure final?" — has a date and a name attached to it.

MODULE 09

The hotel's rules, the hotel's look.

Policies, permissions, integrations and branding are set per property — so a group can standardise the books without standardising the welcome.

Brand & images. A logo and a gallery per property. The palette is read from the logo's own pixels and applied across the desk, the charts and the guest portal.

- **Nineteen permissions, six staff roles.** Least privilege by default; an unknown account never lands on Manager.
- **Money of account.** Invoice prefix, payment terms, approval threshold, discount limit and rate-age guard.
- **Logo-derived theming.** The whole interface repaints from the brand, including charts and the guest portal; status colours stay semantic.
- **Commercial policies.** Deposit percentage, check-in and check-out times, overbooking allowance and cancellation text per property.
- **Integration register.** One place to see which connectors — channel manager, payment gateway, locks, accounting, CRM, WhatsApp — are live per property.
- **Activity and notifications.** A group-wide trail and a tray for the exceptions each desk needs to act on.

SELL THE OUTCOME A new property opens with its own identity and the group's controls on day one — not a two-month configuration project in three different tools.

SECURITY & DEPLOYMENT

Designed to be run by an operator, not only by its authors.

The API refuses to start in production without a database, a strong signing secret and an explicit origin list. Secrets are never defaulted, and the demonstration dataset cannot be loaded into a production install.

CONTROLS IN THE DELIVERED BUILD

Identity	bcrypt password hashing, signed JWT sessions, rate-limited sign-in.
Authorisation	Role and permission checks on every door; property scoping in the data layer.
Configuration guard	Production boot fails unless DATABASE_URL, a 32+ character secret and a non-wildcard origin are set.
Transport & headers	Content-Security-Policy, frame denial, no framework banner; TLS terminated at the proxy.
Operational health	/health checks the database, not just the process; graceful shutdown drains connections.
Data boundary	The web server publishes only the application shell and its assets — never the project root or environment files.
Audit	Every write is attributable; approvals are recorded with actor, reason and time.

Deployment options

Managed: the API and PostgreSQL hosted by the group or a managed platform, the web build served from the same origin.

On-premise: Node.js and PostgreSQL inside the property network, with the same environment guard and backup routine.

Reference architecture. Stateless API behind a load balancer, PostgreSQL with point-in-time recovery, static assets cached at the edge. The health door is what the balancer polls.

What we will not claim. Card acquiring, email and SMS delivery, door-lock hardware and channel-manager connectivity are connectors, not included software. The integration register shows their status; each is scoped and delivered per deployment.

Backup

Database and uploaded brand assets, restore tested before go-live.

Access

Least-privilege database user, named staff accounts, no shared manager login.

Change control

Additive migrations on update; the seed is separated from the schema.

DELIVERY

A pilot property, then the group.

Configuration is led by the hotel's own rate list, policies and month-end questions. The first property proves the controls before the second inherits them.

Discovery & data audit — WEEKS 1–2

Properties, room types, rate plans, tax rules, departments, roles, chart of accounts and the open items the current systems cannot answer.

Configuration — WEEKS 2–5

Properties and rooms, the full price catalogue, policies and thresholds, staff and permissions, branding, document retention.

Data & integration — WEEKS 4–7

Guests, companies, open folios and deposits, suppliers, rate history. Connector scope agreed and delivered against the integration register.

Validation & training — WEEKS 7–9

Parallel run at one property, control tests (price change, refund, split invoice, night audit), role-based training, sign-off of the seeded book.

Go-live & hypercare — WEEKS 9–12

First live night audit supervised, daily check-ins for two weeks, a review of exceptions and a documented handover to the property team.

HOW SUCCESS IS JUDGED

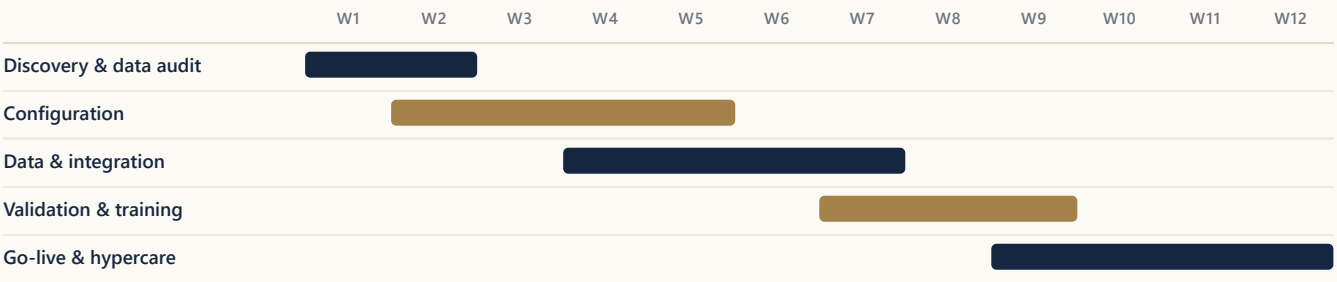

- ✓ The night audit closes the day without a manual reconciliation spreadsheet.
- ✓ Every refund, discount, price change and FX move has a named second signature.
- ✓ A folio, its invoice and the revenue report agree for a sampled stay.
- ✓ Housekeeping release and desk availability agree on every sampled room.
- ✓ Month-end produces the departmental pack from the system, not from exports.

WHAT WE NEED FROM THE HOTEL

- — A product owner with authority to sign off policies and rates.
- — One pilot property and a named lead per department.
- — Read access to current rate lists, open balances and document templates.
- — A test gate before go-live where the desk works a parallel day.

Indicative, not contractual. Durations assume one pilot property and a single integration wave; a group rollout is phased after the pilot review.

INDICATIVE SEQUENCE

Bars show elapsed weeks for one pilot property. Workstreams overlap; the group rollout is phased after the pilot review.

SCOPE & COMMERCIALS

Three ways to buy the same book of record.

Packaging follows the operating job, not a feature count. Pricing is quoted after discovery, when the property count, connectors and migration effort are known.

PACKAGE	DESIGNED FOR	INCLUDES	COMMERCIALS
Core Operations	Single property or a first pilot	Front desk, reservations, guest portal, housekeeping, billing, payments, document register.	Per property, per month
Commercial & Finance	Hotels that need margin control and a clean close	Everything in Core, plus events, revenue and pricing, expenses, financial dashboard, reports and the approval queue.	Per property, per month
Group Edition	Multi-property operators and management companies	Everything in Commercial & Finance, plus group rollups, per-property branding and policies, API access and integration support.	Group agreement

Professional services

Implementation, configuration and migration are quoted as a fixed scope after discovery. Training and hypercare are included in the implementation plan; additional properties inherit the configured model.

Support covers a named contact, business-hours response and critical-incident handling; the service level is agreed in the order form.

What the price includes

Software subscription, updates, the API, role and property administration, and the integration register. Connector licences and third-party fees (payment gateway, channel manager, messaging) are separate.

No per-user fee for the six staff roles; guest access is included.

EXPLICITLY OUT OF SCOPE

- Card acquiring, payment gateway contracts and settlement fees.
- Email, SMS and WhatsApp message delivery.
- Door-lock hardware, wiring and key-card encoding.
- Channel-manager and OTA connectivity beyond the integration register.
- Statutory accounting, tax filing and payroll.
- Data cleansing beyond the agreed migration mapping.

COMMERCIAL TERMS

This document is a scope and approach proposal, not a price offer. A formal quotation follows discovery and is valid for 60 days. Subscription and services are invoiced separately; taxes are additional.

> **Decision needed to proceed:** the pilot property, the package, and the connector list. Those three answers are enough to quote.

FROM PROPOSAL TO PILOT

Four conversations to a signed pilot.

We recommend proving the controls on one property before a group rollout. The pilot is where the rate catalogue, the folio rules and the night audit either match the hotel's reality or get corrected — with the hotel's own numbers.

1. **Discovery call (60 minutes).** Properties, room count, current systems, the reports that matter at month-end, and the first three integration candidates.
2. **Scope and package agreement.** Choose Core, Commercial or Group; name the pilot property and its department leads; agree the connector list.
3. **Formal quotation.** Subscription, implementation, migration and any connector work, with the assumptions written down.
4. **Pilot order and kick-off.** Discovery week starts from the hotel's rate list and open balances; the pilot review decides the group rollout.

> **What you will see in the pilot:** a configured day, a real quote, a split invoice, an approval held for a second signature and a supervised night audit.

PROPOSAL AT A GLANCE

Modules	**Nine operating modules**
Roles	**Six staff + guest**
Properties	**Multi-property, per-property brand**
Financial control	**Second-signature gates**
Audit	**Every write attributed**
Deployment	**Managed or on-premise**
Commercials	**Quoted after discovery**

“Show us the day, the month and the signature behind both.”

That is the walkthrough we will run: a booking priced from the catalogue, a folio paid and split, an approval held, and a night audit closed and sealed.

ACCEPTANCE

By signing below, the parties agree to proceed to discovery against this scope. This signature is not an order and creates no payment obligation; a separate order form will follow the quotation.

For the hotel group — name, title, date

For LHMS — name, title, date

APPENDIX

Who sees what, by design.

Permissions are granted per role and enforced at the door — not by hiding a menu item. The map below is the starting matrix; it is configurable per property.

ROLE	PRIMARY WORKSPACE	MODULES	GUARDRAIL
Manager	Group dashboard, approvals	All nine modules; staff, setup, activity, end of day; cross-property.	Can approve; cannot silently change a closed day.
Front Desk	Today, room map	Reservations, check-in/out, folios, billing, payments, expenses, documents, requests.	Pinned to own property; refunds and discounts gated.
Housekeeping	Supervisor board, my rooms	Tasks, room release, laundry, lost & found, guest requests, expenses, documents.	No rate, folio or payment access.
Revenue	Reports, rate & inventory	Prices, taxes, rate plans, availability, events pricing, reviews, financial dashboards.	Price and bulk changes require a second signature.
Finance Manager	Financial dashboard, approvals	Invoices, expenses, ledgers, reports, approval queue, night-audit review.	Approves money movement; no property configuration.
Auditor	Financial reports, audit trail	Read-only financial statements, settings view, activity and financial trail.	No posting, no approval, no settings write.
Guest	Mobile stay	Own booking, requests, ordering, folio, profile and loyalty.	Sees only their own stay; no staff screens.

19 permissions

From *manage reservations* and *post charges* to *approve financial changes* and *night audit*, granted per role rather than per screen.

Property scoping

Desk and housekeeping are bound to their hotel; managers and finance may work across the group by role.

One trail

Operational and financial writes land in the same activity log, so an auditor does not join two histories.

About the screenshots. Captured from the reference workspace on 2 November 2026: three seeded properties (102 keys), a live trading day, and fictional guest and company names. Figures are in Nigerian naira and follow the catalogue and tax rules shown on each screen. They illustrate the product, not a client's results.
